

COMP1002

Computational Thinking and Problem Solving

Lecture 5

Computation III

Lecture 5

- › Computation in Computers
 - Addition
 - Multiplication
- › Numeric computation vs Symbolic computation
- › Top-down approach vs Bottom-up approach
- › Understanding the limitations of Computers

Computation

- › Teaching the computer to add numbers
- › How do **we** add numbers?

- 2+7?
- 3+8?
- 11+12?
- 17+18?
- 51+56?
- 67+89?
- 1357+8642?

| | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

Computation

› How do **computers** add numbers?

› 2+7?

– 10+111

› 11+12?

– 1011+1100

› 51+56?

– 110011+111000

› 1357+8642?

– 10101001101+10000111000010

$$\begin{array}{r} 10 \\ \underline{111} \end{array}$$

| | 0 | 1 |
|---|----|----|
| 0 | 00 | 01 |
| 1 | 01 | 10 |

$$\begin{array}{r} 1011 \\ \underline{1100} \end{array}$$

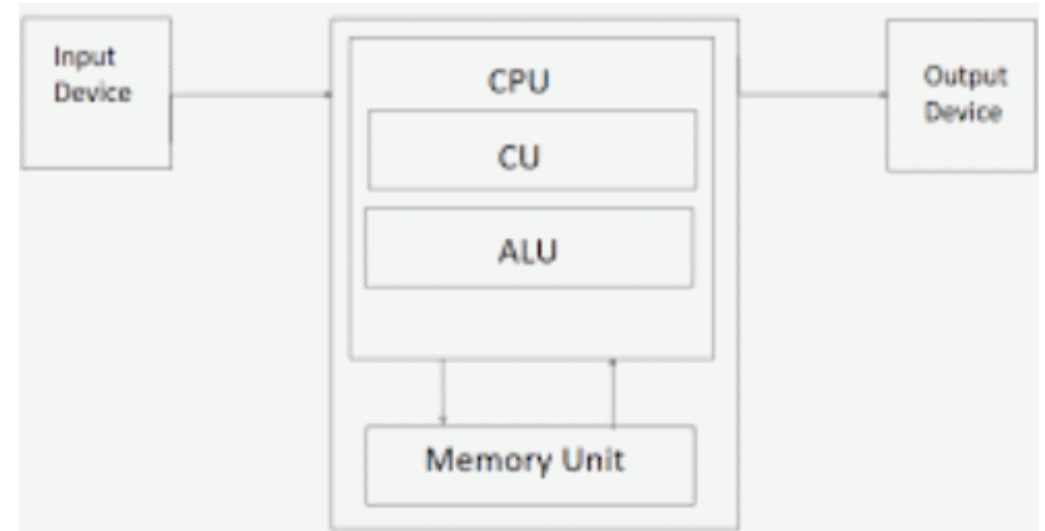

Computation

- › Teaching the computer to add numbers in **human way!**
 - 11+12
 - › Add unit: $1+2 = 3$
 - › Add ten's: $1+1 = 2$
 - › Answer 23
 - 17+18
 - › Add unit: $7+8 = 15$, carry a one to ten's
 - › Add ten's: $1+1 = 2$, add carry $2+1 = 3$
 - › Answer 35

Computation in Computer

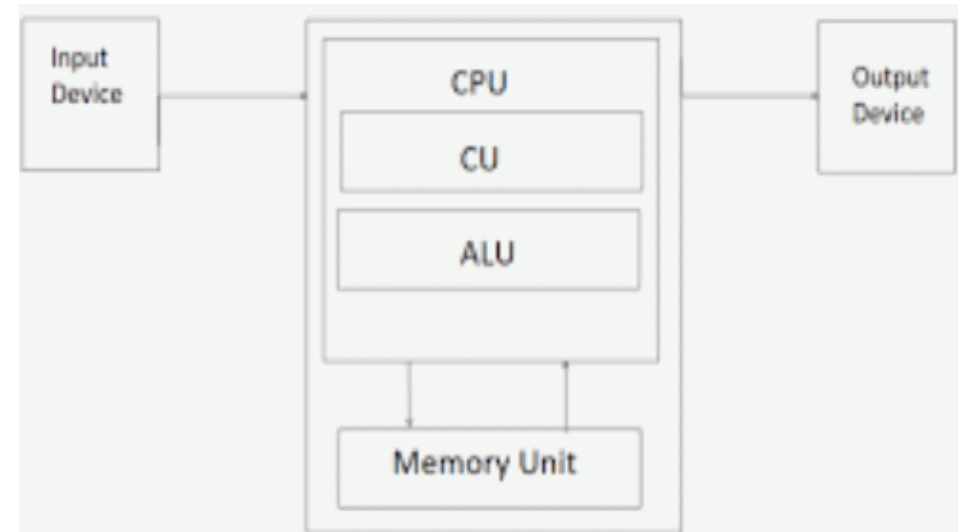

› A computer

- Input
 - › Keyboard
- Output
 - › Screen
- Memory
 - › Store data and program
- CPU (central processing unit)
 - › Perform calculation and run program
 - › ALU (arithmetic logic unit): perform calculation
 - › CU (control unit): control signals inside CPU and arrange for program statement execution using ALU

Computation in Computer

- › Input 3+5
- › Store 3 as 00000011 in binary (assuming 8 bits)
- › Store 5 as 00000101 in binary
- › Compute $00000011 + 00000101$ inside ALU
- › Prepare result 00001000 for output
- › Convert it into decimal as 8 to be output

Computation in Computer

- › A side note on why computers prefer **two's complement** for negative numbers
 - Consider $-3 + 5$
 - › In sign-and-magnitude with 8 bits
 - $10000011 + 00000101 = 10001000$ (i.e., -8)
 - › In two's complement with 8 bits
 - $11111101 + 00000101 = 00000010$ (i.e., 2)
 - › Try other additions
 - $-5 + 3$ and $-5 + (-3)$
 - Note that $-5 = 10000101$ / 11111011 in the the above representations respectively

Addition

- › Teaching the computer to add numbers in our way!
 - We human can add two numbers of arbitrary size
 - Can we add many numbers?
 - › Example: $37+23+33+17+37+40$
 - Two approaches:
 - › Add all unit digits first, then tens, hundreds
 - › Add two numbers first, then add a third one
 - Which is a better approach?
 - › For human and computer?
 - How to express your approach in pseudo-code?

Addition

› Pseudo-code for adding 2 single-digit numbers:

- Input: two single-digit numbers x and y
- Output: the two digits of the sum s_{10}, s_1

look up addition table for row x and column y
let s be the entry
set s_{10} to be the first (left) digit of s
set s_1 to be the second (right) digit of s
return the pair s_{10}, s_1

› Give a name to this “function”, called `add2small(x, y)`

| | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|----|----|----|----|----|----|----|----|----|----|
| 0 | 00 | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 |
| 1 | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 |
| 2 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 |
| 3 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 |
| 4 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 |
| 5 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 |
| 6 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 |
| 7 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 |
| 8 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 |
| 9 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |

Addition

- › Pseudo-code for adding 3 single-digit numbers (to handle a potential carry):
 - Input: three single-digit numbers x , y and c
 - Output: the two digits of the sum s_{10} , s_1

```
a10, a1 = add2small(x, y)
b10, b1 = add2small(a1, c)
d10, d1 = add2small(a10, b10)
set s1 to be b1
set s10 to be d1
return the pair s10, s1
```

- › Give a name to this “function”, called `add3small(x, y, c)`

Addition

- › Pseudo-code for adding 2 multi-digit numbers:
 - Input: two multi-digit numbers $X = (x_mx_{m-1}...x_1)$ and $Y = (y_ny_{n-1}...y_1)$, where X and Y have m and n digits respectively
 - Output: all digits of the sum $S = (s_as_{a-1}...s_1)$

```
set p = maximum of m and n (at least longer of X and Y)
set  $c_1 = 0$ 
for each digit i running from 1 to p
     $a_{10}, a_1 = \text{add3small}(x_i, y_i, c_i)$ 
    set  $c_{i+1} = a_{10}$ 
    set  $s_i = a_1$ 
return the number  $c_{p+1}s_ps_{p-1}...s_1$ 
```

- Give a name to this “function”, called `add2large (X, Y)`

Addition

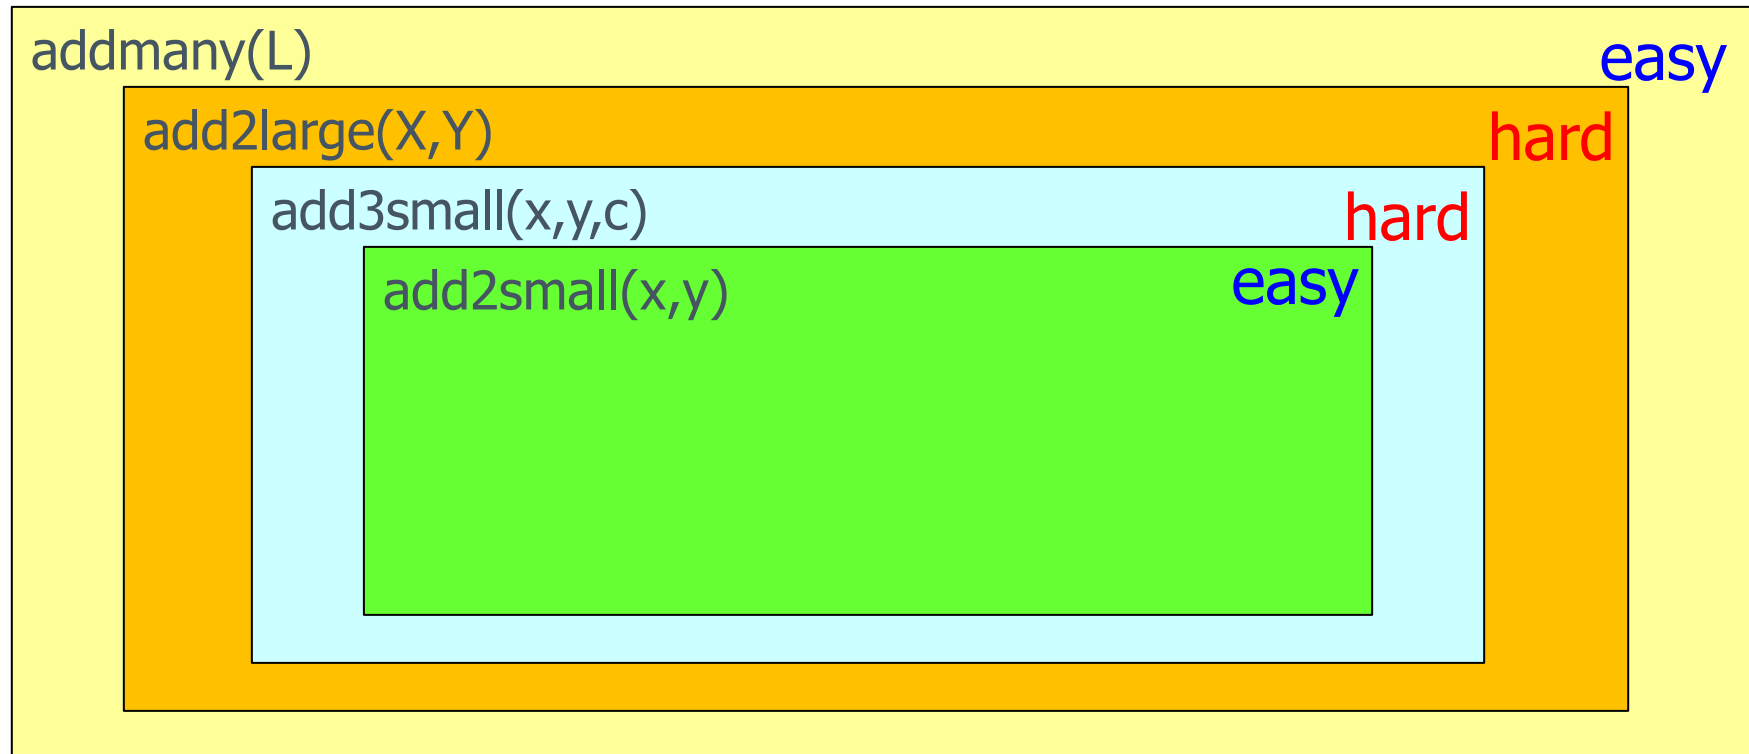

- › We complete the final piece of the puzzle
- › Pseudo-code for adding multiple numbers
 - Input: a list of numbers, L
 - Output: the sum S

```
set S to 0
for each number n in L
    set S = add2large(S, n)
return S
```

- › Give a name to this “function”, called `addmany(L)`

Addition

- › Now, we can add a list of many numbers, each of arbitrary length!

Addition

- › Three types of computational statements are sufficient in our four-step solution
 - Conditional is even not necessary here!
 - Usage of functions will help to reduce 3 copies of `add2small(x, y)` inside `add3small(x, y, c)`
- › One simple addition-table lookup is sufficient
 - As long as we can add two single-digit numbers, we can add two numbers of arbitrary sizes and then multiple numbers
 - Complex solutions could be built upon simpler ones

Computation

- › We can refine our solution from high level gradually to low level
 - Top-down approach
 - › Example: in sorting programs, we assume lower level things can be done without doing them in our design, e.g., finding the smallest number, inserting an item in proper position (Lecture 4)
- › We can build up our solution from simple blocks that we know to work
 - Bottom-up approach
 - › Example: in human way of addition program, we build up from adding 2 small numbers, to 3 small numbers, to 2 big numbers, to many big numbers gradually

Computation

- › Teaching the computer to add numbers in our way
 - Advantage: no limit on the size of the numbers
 - Disadvantage: slower than binary addition
- › Great abstraction
 - Based on very simple table lookup (or definition)
 - It may not be the add operator, but could be multiply, or even any mysterious operator
 - It may not be numbers, but symbols
 - Can be generalized into non-numerical (symbolic) computation

Computation

- › To produce meaningful answers, you do not have to understand what the symbols stand for or why the manipulations are correct (Hector Levesque)
 - Computers are dumb but will work for you following instructions
- › The “trick” of computation (Levesque)
 - Computers can perform a wide variety of impressive activities precisely because those activities can be described as a type of symbol processing that can be carried out purely mechanically
 - Computation is the process of taking symbolic structures, breaking them apart, comparing them, and reassembling them according to a precise recipe called a procedure (or algorithm)
- › This is called symbolic computation

Computation

- › Symbolic computation
 - Computation involving symbols to represent data, in exact value/form
- › Numeric computation
 - Computation involving numbers to represent data, sometimes in approximated value/form
 - › Numbers carry real meaning
 - › Equation solving
 - › Average, summary and statistics of data
 - › Sorting and searching of data
 - › Big data processing, e.g., data mining, clustering
 - Majority of common programs

Multiplication

› Consider the following:

› 23×14

- 4 by 3
- 4 by 2
- Get 92 for 4 by 23
- 1 by 3
- 1 by 2
- Get 23 for 1 by 23
- Add them up

$$\begin{array}{r} 23 \\ \underline{14} \\ 12 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 12 \\ 8 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 92 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 92 \\ 3 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 92 \\ 3 \\ 2 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 92 \\ 23 \end{array}$$

$$\begin{array}{r} 23 \\ \underline{14} \\ 92 \\ \underline{23} \\ 322 \end{array}$$

Multiplication in Computers

› 23 x 14

- 10111 x 1110
- 0 by 10111 = 0
- 1 by 10111 = 10111 next
- Add
- 1 by 10111 = 10111 next
- Add
- 1 by 10111 = 10111 next
- Add
- Answer is $101000010_2 = 322_{10}$

› The operation is simple

- For every digit in the multiplier (starting from the right to left), add the multiplicand for "1", and no add for "0"
- Shift one digit to the left for the multiplicand after each add/no add

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \\ \underline{101110} \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \\ \underline{101110} \\ 101110 \\ \underline{1011100} \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \\ \underline{101110} \\ 101110 \\ \underline{1011100} \\ 10001010 \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \\ \underline{101110} \\ 1011100 \\ \underline{1011100} \\ 10001010 \\ \underline{10111000} \end{array}$$

$$\begin{array}{r} 10111 \\ \underline{1110} \\ 00000 \\ 101110 \\ \underline{101110} \\ 1011100 \\ \underline{1011100} \\ 10001010 \\ \underline{10111000} \\ 101000010 \end{array}$$

Multiplying Large Numbers

- › Our previous solution, `addmany(L)`, to add a list of large numbers is built based on simple table lookup
 - There is no real mathematics done!
- › Now we are able to use real mathematics to help
 - Just generate pseudo-code (then program) that follows the human ways of multiplying decimal numbers together
 - Home Exercise
 - › Write down the pseudocode for multiplying a list of integers

Computation

- › Are computers incredibly dumb?
 - Basically yes, but ...
 - Recent machine learning techniques enable computers to deduce “knowledge” from large collection of data for artificial intelligence
 - Computers can now generate some “new” things!
- › Are computers incredibly accurate?
 - Basically yes, but ...
 - Not all computers can calculate $123456789 * 987654321$ accurately
 - Try this in Python
 - › $12345678.9 * 98765432.1$
 - › How can we make it accurate?

```
>>> 12345678.9 * 98765432.1  
1219326311126352.8
```

Computation

- › We need to be careful and always be aware of **limitations and pitfalls** when exercising computational thinking to solve problems
- › We should design the **program (algorithm/pseudo-code)** in a more general manner
- › We should normally not assume input data to be correct and should perform proper error checking (called input validation)
 - You cannot add together inputs that are not numbers
 - You cannot divide a number by zero
 - You cannot compare an integer with a string to see which one is larger
 - You may not allow punctuation marks in the name of person

Summary

- › Computation in Computers
 - Addition
 - Multiplication
- › Numeric computation vs Symbolic computation
- › Top-down approach vs Bottom-up approach
- › Understanding the limitations of Computers
